

Take-Home Challenge: Order History

Overview

Build a purchase history experience in React Native that allows users to view past orders and share events with friends. You are encouraged to use AI-assisted code generation tools (Cursor, Copilot, Claude, etc.) to help you build this.

Requirements

- Display a list of the user's past purchases
 - Tapping a purchase opens a detail screen with:
 - Event name and information
 - Receipt with price breakdown
 - "Share with Friends" feature that generates a calendar event to share
 - Simulate network calls with mock data (no live backend required)
 - Include test coverage
-

API

Endpoints

None

GET /orders

GET /orders/:orderId

Types

typescript

TypeScript

```
// =====  
// CORE ENTITIES  
// =====
```

```
interface Event {
    id: string
    name: string
    datetime: string
    imageUrl: string
    venue: string           // "Chase Center, San Francisco, CA"
}
```

```
interface Seat {
    section: string
    row: string
    seat: string
}
```

```
// =====
// ORDER / PURCHASE
// =====
```

```
interface Order {
    id: string
    confirmationNumber: string
    event: Event
    seats: Seat[]
    status: OrderStatus
    receipt: Receipt
    payment: PaymentSummary
    purchaseDate: string
}
```

```
type OrderStatus = 'placed' | 'confirmed' | 'completed' |
'cancelled' | 'refunded'
```

```
// =====
// RECEIPT / PRICE BREAKDOWN
// =====
```

```
interface Receipt {
    quantity: number
}
```

```

    pricePerTicket: number    // cents
    subtotal: number          // cents (price × quantity)
    fees: number               // cents
    salesTax: number           // cents
    discount?: Discount
    total: number              // cents
}

interface Discount {
    code: string
    amount: number             // cents saved
}

// =====
// PAYMENT
// =====
interface PaymentSummary {
    method: PaymentMethod
    lastFour?: string           // "4242" for cards
    cardType?: string           // "visa", "mastercard", etc.
}

type PaymentMethod = 'creditcard' | 'applepay' | 'paypal' | 'venmo'

// =====
// API RESPONSES
// =====
interface GetOrdersResponse {
    orders: Order[]
    page: number
    perPage: number
}

interface GetOrderResponse {
    order: Order
}

```

Submission

Please provide:

1. A link to a GitHub repository (or zip file) with your code
2. Instructions to run the app locally

Be prepared to discuss your tradeoffs, architectural decisions, and any improvements you'd make with more time.

Time Expectation

This challenge is designed to take **3-4 hours**.
